HACE : The Child Labour Index

The hidden problem that could devalue your investments

Most companies don't have the ability to effectively identify, manage or remediate child labour in their supply chains.

Investing in a company where child labour arises in their supply chain could directly affect the value of your holdings.

The solution: HACE's Child Labour Index

Our Child Labour Index is the only quantitative metric in the world for child labour performance at a company and group level.

The Child Labour Index scores enable reliable and up-to-date monitoring of company performance in two formats; a user-friendly portal, or an API integration into your existing ESG monitoring platforms.

As domain experts, our robust and transparent scoring methodology is based on deep subject-matter expertise, AI and comprehensive data analysis.

Why is considering child labour important to my investments?

The potential impact of child labour on companies is complex, through financial, legal, reputational and operational risk.

Recent and upcoming legislation focuses specifically on child labour and has increasingly severe consequences for companies and investors

Monitoring with the Child Labour Index ensures you know which companies are compliant and provides the only global quantitative child labour metric to comply with SFDR and ISSB reporting requirements.
